

TO WHOM IT MAY CONCERN:

November 29, 1993

Our community has been using Acti-Zyme for over 25 years.

From the beginning we have introduced our weekly maintenance treatments through the manholes and pump stations. In this way we have been able to keep the collection system free of sludge buildup. We always treat the troublesome lines which are flat and slow moving, and which used to require emergency removal on occasion. Also since the product is strictly organic, non-caustic and non-chemical, it cannot do any damage to the sewer mains. These weekly maintenance treatments of **ACTI-ZYME** continue on to the sewage lagoons, reducing sludge buildup and odour there as well.

In 1988 we decided to drain the primary lagoon, assuming that it would be necessary to remove the sludge that had accumulated over the last 25 to 30 years. We found, somewhat to our surprise, that there was almost no sludge buildup at all, and that the expensive drag line removal of sludge we had anticipated, would not be necessary.

We are extremely pleased with the results we have obtained up to this time, as we are not only able to keep the sludge problem under control, we also have only a minimal odour period at Spring Breakup.

We are continuing to use the product, and considering the results we have obtain, we would not hesitate to recommend the product to any community that want to reduce sewage disposal problems.

Yours truly,
